An introduction to Intelligent Trading Tech

Our mission at Intelligent Trading Tech is to increase adoption and awareness of cryptocurrencies on a large scale. We are using the hyperbolic technology and artificial intelligence to identify market signals and patterns that cannot be programmed by humans. By applying artificial intelligence and technical analysis, our fleet of data bots are following real-time data sources and send you actionable alerts for success in cryptocurrency markets. We are building an advanced tool that will undoubtedly help you become a more knowledgeable and successful trader.

Our bot is designed for everyone from beginners to professional traders in the cryptocurrency markets. Our advanced ITT platform will send you an actionable and personalized alert, which you could use to successfully trade with. The bot is capable of delivering these alerts by automated trading solutions, which are powered by cutting-edge technology.

Why have we made this advanced trading bot?

Cryptocurrency markets are extremely nascent and volatile. Volatility measures the differences in the price of a certain financial instrument on the market within a certain period of time. This is commonly tied with the risk level of an instrument. It is very important to understand the
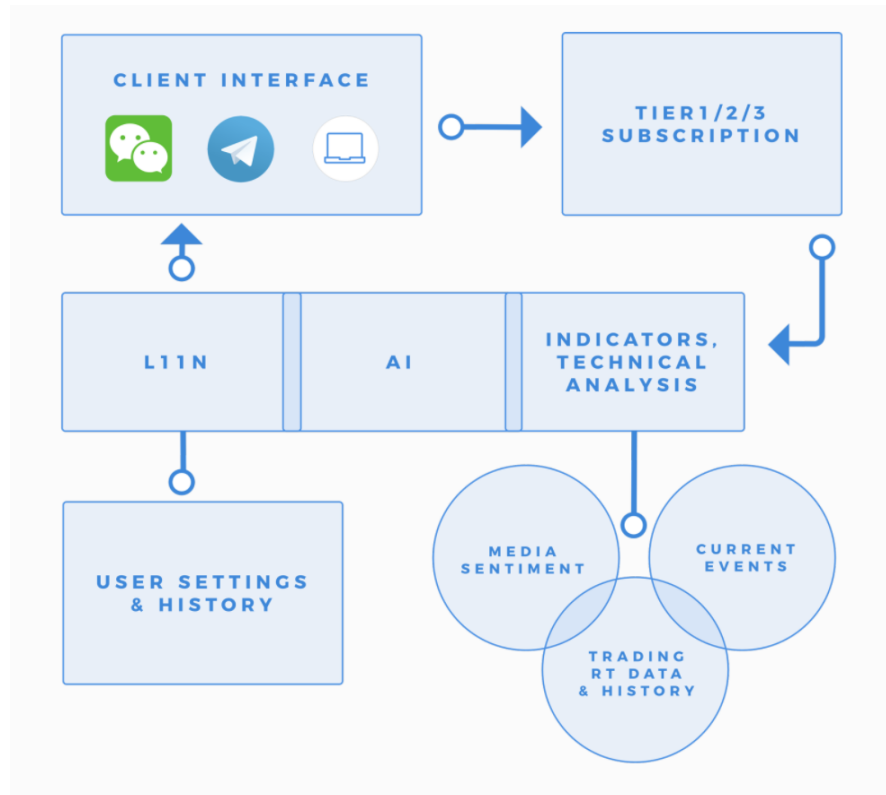

underlaying principles of the volatility of all the cryptocurrencies in the market if you are looking to invest in the cryptocurrency space. It takes a lot of time to filter out all the noise in the markets and build a truly solid trading strategy. This is where our advanced bot stands out.

The matter of fact is that simply looking at the FA & TA is not enough. However, there still are many day traders out there trying to profit from this strategy. Fortunately, trading using TA works really well in cryptocurrency markets. The underlaying goal is to provide quality data to our end-users, so you can make educated choices.

Also, all the cumulated price movements of alt-coins across multiple exchanges, is the initial torrent of data which the users must ingest, to effectively trade these cryptocurrencies. It is a fact that the most experienced traders rely on a host of services that help them derive the insights from the variables of market indicators, which are popping up constantly.
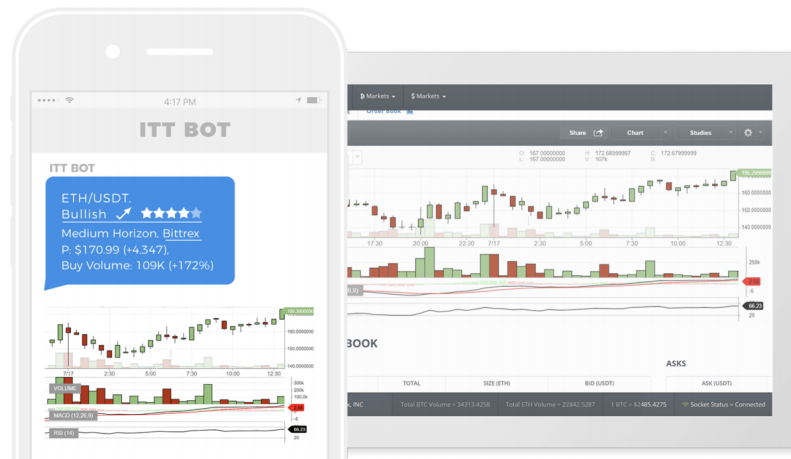

How does it work?

Our state-of-the-art data science tools and neural networks should be employed to provide actionable real-time trading signals for success in the cryptocurrency markets. The fact is that these disruptive technologies are consistently changing our lives. It is time to leverage these technologies into the cryptocurrency markets.

Our trading bots can be fully customized to fit your personal need for a time of day, level of trading volumes, risk level, and preferred trading frequency, just to name a few indicators. The glory lays in the fact that ITT assists all traders. We understand that there are many beginners as well as expert traders, to fit the need of all traders, our advanced tool assists all of them, by monitoring all the relevant information. Our tool will then send you an actionable trading alert during the day in time for you to make the final call whether to open your trade or not.

The platform of ITT learns from historical prices and volume. Our fleet of data bots are constantly scanning and learning from the vast data available on the internet. At times, mere humans may perceive the cryptocurrency market as very unpredictable, when in fact clear patterns emerge when reading between the lines. Therefore, our advanced tool is expected to be very useful if the market environment is consistent with the near past.

The alerts provided from our advanced tool are easy to understand for the beginner and expert traders. By clicking on the alert link, users will be taken to a summary of what triggered the trading alerts.

The ITT team is made up of professionals in artificial intelligence, asset management, capital markets trading, algorithmic trading, quantitative finance, and software development. We are all coming together to deploy this new state-of-the-art platform.

We immediately understood the need of beginner as well as expert traders, the need to develop an intelligent tool which helps in monitoring all the data that is available in the cryptocurrency markets. This is why decided to create our advanced trading tool, which will do all the heavy lifting and truly provide an added value to the end-user trader's arsenal.

Our technology architecture

Tokens: Total supply of ITT-tokens(ERC-20 token)is 11,500,000 tokens.
Contracts: Service subscription in contract
Blockchain: Ethereum network Scalability: 99.99% uptime as containerized on Google Cloud Platform
Performance: 800ms SLA target for data-point to user push notification
Decentralized and Redundant: Ethereum network
Secure and Foolproof: User session is anonymous and no user data is touched in Tier 1, 2 subscriptions. Tier 3 is hosted internally on private servers in Switzerland.
